

Autonomous meeting-to-execution enforcement.

Executor closes the gap between "we decided" and "it got done" by turning meetings into tracked commitments, risk signals, follow-ups, and manager escalations.

Voice to commitments

Speechmatics captures live meetings and uploaded audio.

Reasoning layer

Gemini extracts owners, dates, priorities, and evidence.

Execution loop

Vultr monitor enforces overdue work every six hours.

PROBLEM

Action items fail after the meeting, not during extraction.

The real gap

Teams leave meetings with decisions, but ownership, deadlines, reminders, and escalation paths are scattered or missing.

Why summaries are not enough

A summary is passive. Execution needs assignment, monitoring, risk scoring, tool sync, and accountable follow-through.

- Commitments are buried across recordings, notes, and chat threads.
- Project tools do not know which meeting created the work.
- Managers discover stalled commitments after deadlines slip.

SOLUTION

A five-agent pipeline that keeps work moving.

1

Ingestion

Live Speechmatics transcription or transcript upload.

2

Extraction

Gemini returns structured action items and source quotes.

3

Assignment

Tasks sync into Jira, Asana, and Notion.

4

Monitoring

Risk score updates as deadlines and status change.

5

Escalation

Follow-ups and manager drafts with human review.

ARCHITECTURE

Production-shaped stack, not a static demo.

Frontend

React, TanStack Start, Tailwind, Cloudflare Workers deployment.

Data and auth

Supabase Auth, Postgres tables, RLS-ready design, audit log.

AI reasoning

Gemini Flash or Pro for extraction, risk, and email drafting.

Voice

Speechmatics real-time transcription for live meetings.

Execution tools

Jira, Asana, and Notion APIs create external task records.

Enforcement

Vultr Ubuntu VM, PM2, cron schedule, monitor endpoint.

AUTONOMY

The monitor runs after people stop watching.

6h

The Vultr worker checks commitments every six hours and can also be triggered manually for demos.

- Flags overdue or stalled items based on deadline and status.
- Drafts owner follow-ups with context from the source meeting.
- Escalates to a manager after repeated unanswered follow-ups.
- Stores every action in the audit log for traceability.

DEMO FLOW

What judges can try in the live app.

Meeting intake

Start a live meeting or upload a transcript, then extract action items with owners, dates, priorities, and evidence quotes.

Execution dashboard

View commitments, edit missing owner or manager details, mark completion, and inspect risk state.

Tool sync

Push selected tasks into Jira, Asana, or Notion from the meeting detail screen.

Follow-up enforcement

Review AI-drafted owner emails and manager escalations before sending.

IMPACT

Executor turns meeting intelligence into operating discipline.

Business value

Reduces dropped commitments and manual follow-up work.

Enterprise fit

Works with existing project systems instead of replacing them.

Autonomous guardrails

Human review, audit logs, and manager override paths.

Built with Gemini, Speechmatics, Vultr, Supabase, Cloudflare Workers, Jira, Asana, Notion, and Resend.
